

Junwen Lou

Jinhua, Zhejiang, China | +86 139 6745 7331 | 3490870833@qq.com

GitHub: <https://github.com/lljjjwww333>

Research focus: Weak supervision, financial time-series analysis, and model evaluation.

Education

Henan Polytechnic University

Bachelor's Degree in Software Engineering | Sep 2022 - Jun 2026

Relevant coursework: Artificial Intelligence, Algorithm Design and Analysis, Database Systems, Computer Organization, and Software Engineering.

Research Experience

Auditing Weakly Supervised Cryptocurrency Risk States

First author | Henan Polytechnic University

- Conceived the study and implemented a three-axis audit protocol to evaluate proxy-label agreement, temporal stability, and ex-post risk semantics in weakly supervised market-state learning.
- Conducted experiments using hourly data for five cryptocurrencies, including temporal-model benchmarks on Bitcoin and Ethereum and Transformer- and PatchTST-style stress tests on Bitcoin.
- Performed baseline comparisons, ablations, label-design controls, and block-bootstrap analysis. Found that stronger label fit need not imply better risk stratification, with results dependent on the drawdown information encoded in the labels.
- Developed the Semantic Orientation Ratio as a diagnostic for proxy-label misalignment; identified XRP as a boundary case, while establishing limits on the diagnostic's use for general model ranking.
- Drafted the manuscript as first author, integrating the methodology, experimental results, and limitations.

Financial News Sentiment Classification

NLP project | LSTM

- Adapted an open-source implementation to build an LSTM-based model for three-class financial news sentiment classification.
- Built a preprocessing workflow for labeled news, including text cleaning, tokenization, stop-word removal, and train/test partitioning.
- Created charts of sentiment distributions and daily trends to make model predictions easier to interpret.

Manuscripts

Lou, J., Zhang, F., & Tian, S. Auditing Weakly Supervised Cryptocurrency Risk-State Learning: When Label Fit, Stability, and Semantics Disagree. Manuscript.

Technical Skills

Programming: Python and Java.

Frameworks and tools: React, FastAPI, SQLAlchemy, Linux, and Git.

Selected Technical Projects

Zpboard Stock Dashboard

React, FastAPI, WebSocket, and LLM integration

- Developed a stock dashboard with WebSocket data pipelines for near-real-time updates and an OpenAI-compatible interface for automated market analysis.
- Integrated financial-news summarization, keyword extraction, and sentiment analysis into the dashboard.

[Project demo](#)

Zpblog Personal Blog Platform

React, FastAPI, and SQLAlchemy

- Developed a full-stack application with article management, user authentication, social interaction, and comments.
- Implemented RESTful APIs and database migrations, and deployed the application to a server.

Professional Experience

Hithink RoyalFlush Information Network Co., Ltd.

IT Development Intern | Jan 2026 - Apr 2026

- Integrated trading-system data into risk-control workflows to automate daily tracking of positions and transactions.
- Contributed to Spark/Hadoop cluster setup, parameter tuning, server maintenance, and high-availability monitoring.
- Maintained OpenClaw tooling to support the research team's strategy backtesting and quantitative analysis.

China Postal Savings Bank

Consumer Credit Department Intern | Jul 2023 - Aug 2023

- Assisted credit managers with daily operations and organized customer credit application materials, checking documentation for accuracy.

Honors and Qualifications

- University-level Scholarship.
- Third Prize, university-level Challenge Cup competition.
- Software Designer Certificate.
- One Chinese invention patent application under substantive examination.

Languages

Chinese: Native. English: IELTS 6.5 overall, with no component below 6.0; CET-6.
